

LiquidJet Diamond Coldplates can increase AI Factory profitability by up to 35%

AI Industry Unicorn, Frore Systems' latest coldplate innovation, LiquidJet Diamond, improves extreme hotspot cooling, significantly increasing the efficiency and profitability of AI Data Centers

SAN JOSE, California — October 7, 2026 — Frore Systems today announced LiquidJet Diamond, a new AI Factory liquid cooling coldplate featuring an integrated diamond spreader. The accelerating demand for AI Tokens, coupled with energy scarcity, is spurring hyperscalers to find new ways to increase the efficiency of AI Factories. LiquidJet Diamond Coldplate boosts AI Tokens/Watt and revenue by 35% compared to traditional skived coldplates, with the increased revenue flowing directly to profit.

LiquidJet Diamond builds on the previously announced Frore Systems LiquidJet coldplate. LiquidJet coldplate employs a unique 3D ultra short-loop multi-stage design which can be precisely customized to the power map of each GPU, including extreme hotspots. This precision is critical as GPUs grow in complexity and power draw to meet AI demand. LiquidJet delivers 12 °C reduction in GPU die temperature which directly translates to 25% higher Tokens/Watt efficiency. LiquidJet Diamond adds an additional spreader with integrated diamond wafers to the coldplate bottom, positioned precisely at the hotspot locations. LiquidJet Diamond delivers an additional 10 °C reduction in hotspot die temperature, boosting increase in Tokens/Watt to 35%.

"AI Factories are facing major performance barriers," said Seshu Madhavapeddy, Founder and CEO of Frore Systems. "GPUs are increasing power density and creating extreme hotspots which, if not properly cooled, hinder the GPU from maximizing performance. LiquidJet Diamond, which features an integrated diamond spreader in addition to innovative 3D ultra short-loop multi-stage design, can cool extreme hotspots up to 770 W/ cm², unleashing high-performance AI GPUs and delivering even more AI Tokens/Watt." He continued, "When each GPU is more efficient, each AI Token costs less to produce, and more AI Tokens can be generated within the available power budget, using the same AI Factory infrastructure. This increases AI Factory profitability, while conserving local resources."

Power available to AI Factories is finite and expensive to expand. Utility interconnection, transformer capacity, and physical power delivery infrastructure are all limiting factors on total AI Factory power draw and are areas which have local communities increasingly concerned. Facing this power constraint, AI Factory operators understand that power is a strategic asset, and every watt allocated must be used to generate tokens as efficiently as possible.

"If each AI Factory could produce 35% more AI Tokens with the same resources by deploying LiquidJet Diamond, hyperscalers would reach their growth goals faster with fewer AI Factories," Seshu commented. "Each new AI Factory costs tens of billions of dollars to build and more to operate, so the ability to generate more AI Tokens/Watt with existing resources can significantly increase profits, conserve energy and make a significant difference to all stakeholders."

LiquidJet® Diamond: The innovative 3D ultra short-loop multi-stage coldplate built for the rapid growth of AI

LiquidJet Diamond performance compared to a skived coldplate:

- Hotspot cooling: over 150% higher max power density
- 75% higher heat transfer efficiency

- 16 - 22 °C cooler GPU
- 30 - 35% more AI Tokens/Watt
- Seamless drop-in upgrade

Designed to scale to meet AI data center demand, in both size and volume.

LiquidJet addresses the industry's most pressing thermal challenges — not only through superior performance and hotspot management, but also through its ability to scale to hyperscaler volumes.

Traditional skiving cannot deliver the exacting thermal performance demanded by today's AI GPUs. Newer approaches such as ECAM (electrochemical additive manufacturing, also known as 3D metal printing) offer design flexibility but cannot meet hyperscaler quality, reliability, volumes, or timelines. LiquidJet combines the precision of semiconductor fabrication with high-volume manufacturing capability — satisfying both the performance and scale requirements of leading AI data center coldplate deployments.

Higher thermal performance and high-volume manufacturing are not the only challenges LiquidJet solves. GPU die sizes are increasing dramatically. Die sizes range from 1,488 mm² NVIDIA Blackwell Ultra all the way to 46,225 mm² Cerebras Wafer-Scale Engine, roughly 30x the footprint. With LiquidJet, Frore Systems has pioneered the only coldplate manufacturing process capable of supporting not only the power and performance, but also the size requirement of these larger AI GPUs.

About Frore Systems

Frore Systems is a pioneer in advanced thermal technologies that unleash performance across data centers and edge devices. The company's flagship solutions include **AirJet®**, the world's first solid-state active air-cooling chip used in consumer, industrial, and IoT markets delivering higher performance in ultra-compact, silent, light, dustproof and water-resistant edge devices; **LiquidJet®**, a 3D ultra short-loop multi-stage liquid cooling coldplate for data centers and **LiquidJet® Diamond** with an integrated diamond spreader, delivering higher GPU performance, AI token throughput, improved PUE and reduced TCO; and **LiquidJet® Nexus**, a lightweight integrated coldplate system that integrates multiple LiquidJets and eliminates all hoses, connectors and manifolds enabling ½U compute trays. Frore Systems' patented cooling technologies are integrated into products from major OEMs and system builders worldwide. Headquartered in Silicon Valley, with manufacturing operations in Taiwan, Frore Systems is redefining thermal architecture for the AI era. For more information, visit:
